## **Classic Automation's Growth Triggers Move to Larger Facility**

For Immediate Release

Rochester, NY - September 19, 2006,

Classic Automation, an international provider of parts, products and services for installed control systems, has experienced rapid growth that has prompted the need for the company to move to a larger facility. The new building is approximately 15,000 square feet. The company purchased the building in August 2006, and will have fully transferred operations to the new location by the middle of October.

The new facility is located at 795 Monroe Avenue, in Rochester, New York.

“We are seeing increasing needs for industrial companies to prolong the useful life of their control systems”, explains Fritz Ruebeck, company president. “We provide quality surplus parts on a high availability basis. This move lets us expand our test labs and the amount of parts stocked to meet our customers’ emergency needs.”
